

SDK integration

Adding SDK to Android project

SDK is delivered in .jar format and can be included by following these steps:

- Inside app's build.gradle module create libs folder if one does not exist.
- Put the JAR archive into libs folder.
- In app project's build.gradle file, in dependencies add the following line if one does not exist:

```
compile fileTree(dir: 'libs', include: ['*.jar'])
```

or

```
implementation fileTree(dir: 'libs', include: ['*.jar'])
```

This will add JAR archive to the project classpath. If project uses *Android Gradle plugin 3.0* or newer, `implementation` scope should be used, `compile` otherwise.
